

Trust worthy

- 1: Cash on hand? Do they have enough?
- 2: Did they double spend?

Block → Trustworthiness + Anonymity
Chain

Transactions

User A → Public Key A + Private Key A
User B → Public Key B + Private Key B

Transaction

- 1 { User A w/ Public Key A gives so many [bitcoin] to User B w/ Public Key B }
Donation to miner
- 2 { User A w/ Public Key A gives so many [bitcoin] to whoever mines this }
- 3 { Signed by all Party's private keys }

Block Chain

Linked List

Forward Pointer

Block Chain

Backward Pointers

Pointer is the hash of the previous block.

- 1 - Backward Pointer
- 2 - List of open Transactions
- 2a - Public key of miner
- 3 - Nonce

→ Unit of work

- The hash of the block (which includes the nonce) must be below a threshold.
- This threshold is constantly changed by the community to keep average mining time constant.

Sync w/ Deltas & Whole Model

Server

- whole model
- listen for deltas
- send delta + hash

Clients

- ask for whole model on boot
- send deltas
- listen for delta + hash
